The talk on one page

> “A satellite position can be jammed or faked, and the vehicle believes it. TrustNav checks every position, every second, gives it a trust score from 0 to 100, says why in plain words, and below 50 it refuses the position and tracks the vehicle by its odometer.”

1. **Problem.** Satellite signals are weak and not authenticated. Jamming is noise: the position disappears. Spoofing is a false signal: the position is wrong but looks normal. Existing tools give one flag inside one receiver; nobody gives a fleet a per-second, explained score **with a response**.
2. **Method.** Receiver output, then 36 features, then **two witnesses**: 16 rules (physical limits) and a model trained on normal driving only. A noisy-OR fuses them (either witness can raise the alarm) into a trust score. The response: **accept, hold, release**.
3. **Results.** 7 of 7 attacks caught, 6 within one second. Precision **99.3 %**, recall **96.1 %**, false alarms **0.44 %**. On a real spoofer (Jammertest 2024, Norway) our first version missed it for **21 min 49 s**; with a 16th rule, receiver time against the clock of the phone, it is caught in the **same second** and 909 of 909 false positions are refused. Real jamming: 15 of 20.
4. **Demonstration.** Replay, Teleport spoof, Play the story: the score falls to 15 and the position 8 km away is refused. Then Results, Real attacks.
5. **Limits and next steps.** The simulator numbers are an upper bound. The real attacks are two days of one campaign. The response needs an odometer and a route. Next: our own receiver, a second antenna, real Galileo signatures, a drone, an edge box.

If everything else is forgotten: detects, explains, responds · 99.3 / 96.1 / 0.44 · 21 min 49 s, then the same second.

What the jury marks, and where we answer it

Grid	Point examined	Where
Oral, form	A clear talk that makes people want to listen; clear supports	One message per slide (last column of the running order). Speak to the room, not to the screen.
Oral, content	The problem	Slide 2
	The method, argued	Slides 3 to 5
	The results	Slides 6 to 8
	The demonstration	Slide 9 and the live console
	The perspectives	Slide 10
Report	Structure, expression, layout, figures and captions	Cover, abstract in English and French, contents with pages, three annexes, eight figures
	Subject and objectives; requirements; approach and choices; critique and perspectives	Report sections 2, 3, 4, 10 and 11
Work	Project management and roles	Report sections 13 and 14, and the question on organisation
	What was built	The live site, the public repository, 42 tests and 109 end-to-end checks
	Critical mind, autonomy, curiosity	Slide 8: we went looking for real recordings, found our own miss, and say so
